CIRCULAR TO PROFESSIONAL INSTITUTIONS

Who should know
Building owners, Developers, Architects, Engineers, Transport/Traffic Consultants and Builders.

PUBLICATION OF LTA’S QUICK GUIDE SERIES FOR DEVELOPMENT RELATED PROPOSALS – ‘MANAGING MANHOLES DISPLACED BY ROAD WIDENING / IMPROVEMENTS’

1. LTA has released a publication of our ‘Quick Guide Series for Development Related Proposals’, titled ‘Managing Manholes Displaced by Road Widening/Improvements’. In this publication, we clarify LTA’s requirements pertaining to service manholes displaced onto the road carriageway. We also share on the processes and possible solutions industry professionals may consider as part of their submissions. A publication of this guide is available at LTA’s corporate website, under Industry & Innovations > Industry Matters > Development & Construction Resources > Guidelines.

2. The ‘Quick Guide Series for Development Related Proposals’ was launched in April 2020, and 4 publications have been made till date. The series focusses on street works, vehicle parking and rail & road structural protection proposals. The guides complement the existing resource publications and facilitate a deeper understanding of specific issues content on pertinent issues in the built environment in an engaging manner.

Feedback

3. As we strive to continually feature engaging and informative content for our future publications, we are currently conducting a survey on industry’s receptivity to our Quick Guide Series. We would like to hear your feedback on the areas done right, as well as any areas for improvement. The feedback received will help us to improve the quality of the guides.
4. Please take some time to complete an online survey form, which can be accessed at the following weblink: https://forms.gle/VuiVnTcne7HaJ7mQ9. Alternatively, you may wish to scan the following QR code to access the form directly:

![QR Code]

5. We hope that the guides are useful to you. We would appreciate it if you could convey the contents of this circular to relevant members of your respective organisations. If you have any queries, or suggestions on what you would like to see in future guides, please do not hesitate to reach out to us at lta-dbc_registry@lta.gov.sg.

6. Thank you

Koh Min Ee
Director
Development & Building Control
Preface:

As part of development requirements, proposed civil works sometimes affect existing utility services located beneath the public streets. To ensure the safety and comfort of road users, manholes should be situated outside of the carriageway where possible.

This quick guide seeks to clarify LTA’s requirements pertaining to service manholes displaced onto the road carriageway due to road widening/improvement works. In this guide, we will explain the required processes and outline the possible options that should be explored by the qualified practitioner (QP) as part of his/her design development.

Introduction:

Under the standard road typology (refer to Figure 1), side-table space is safeguarded for tree planting and to house the relevant services and utilities. As this available space is limited, it is unavoidable for services to run below the road carriageway.

LTA allows the use of carriageway space within the public streets to house services and utilities. However, the implemented services need to comply with technical specifications, and must not affect the proper design of road elements.

Figure 1: Depiction of a typical road layout for a divided 2 way road
Manholes (MH), chambers and valves shall not be introduced or displaced onto the carriageway, as they pose a safety threat (i.e. serious injury or potential fatality) to road users. In particular, motorcyclists are the most vulnerable user group, and they are highly susceptible to the following risks:

i. **Skid/Slip Issues**
   - Motorcyclists run a high risk of skidding during rainy days, or during occasions when there is debris (loose sand) on the MH cover.

ii. **Road Hazard**
   - MH structures within carriageway causes differential settlement of road pavement. This results in a protruded or depressed road profile that is hazardous to motorcyclists.
   - Poor maintenance by apparatus owner results in defective road conditions e.g. spalled concrete, broken/dislodged cover, broken up of premix around manhole covers. These defects constitute as further road hazards.

**Figure 2: Safety Hazards on Road Carriageway due to Manholes**
As part of road improvement/modification works, existing services and their manholes may inadvertently be displaced onto the road carriageway. A straightforward solution would be to relocate the services and their manholes onto the road side table. However, full service diversion is costly and takes a long time.

As an alternative, LTA has been working with QPs to identify, explore and implement alternate solutions to relocate manholes out of road carriageway instead of relocating the services entirely. LTA allows manholes to be retained if they are adjusted/designed to sufficiently address safety considerations.

Some workable options are as follows:
- Adjustment to move manhole out of wheel path; e.g. by changing proposed scheme, or shifting chevron/ center median
- Structural modification to relocate MH cover
- Burying the MH
- Eliminating/reducing the number of manholes

The following figure illustrates the various workable options which were identified and implemented for various road infrastructure projects:

- **Adjustment in proposed scheme to avoid MH**
- **Structural modification to relocate MH cover**
- **Burying the MH**
- **Shifting of MH into verge**

Figure 3: Depiction of various options to resolve issue of manholes on road carriageways.
What if none of the solutions are applicable?

If QPs encounter a case where a service and its manhole cannot avoid being displaced onto the carriageway, please take note of the following processes:

**Step 1:**
- As part of design development, consider possible options (see previous page) to comply with the technical requirements of not displacing MH/Valve onto carriageway.

**Step 2:**
- LTA will only consider retention of displaced MH/Valve onto carriageway after all alternative options have been exhausted and with any risk being mitigated/ minimised.

**Step 3:**
- Any waiver request to allow the retention of displaced MH/Valve onto carriageway shall be accompanied with an endorsed report (as part of BP correspondence) to properly document the study process and recommendations after balancing all considerations and factors.

As a guide, the report shall minimally contain the following:
- Clear plans reflecting the affected MH/Valve that is proposed to be retained on carriageway
- Clear explanation on explored options/solutions. Suitable drawings (section and details) shall be furnished to develop in-depth explanation.
- Supporting evidence and elaboration to substantiate encountered constraints or issues that render explored options infeasible.
- Necessary cost and impact assessment for various options.
- Correspondence record of technical discussion between QP and apparatus owner.
- Measures to mitigate risks caused by MH/Valve on road carriageway

When the submitted report is in order, LTA will issue a formal acknowledgement receipt. LTA will inform QPs on the outcome of their appeal within a month from the date of acknowledgement.

**Submission Checklist**

To aid industry professionals prepare a complete report, LTA has developed a submission checklist specifying the plans and details to be provided. The document can be downloaded from LTA’s corporate website, under Industry & Innovations > Industry Matters > Development & Construction resources.

Access the checklists by scanning this QR code and then navigating to the ‘Forms & Checklists’ tab.

Quick Guide Series, brought to you by Development & Building Control Division
With effect from April 2020, LTA has published a series of quick guides to broaden and consolidate understanding of LTA’s building plan regulations and processes. The guides feature in-depth explanation of the principles behind specific requirements, coupled with examples of good practices & common mistakes.

LTA has developed a publication roadmap for the year 2021, with topics featured herein relating to pertinent issues emerging within the built-environment. All publications are made available at LTA’s corporate website, under Industry & Innovations > Industry Matters > Development & Construction resources.

### To be Published in 2021
- Manholes within the road carriageway
- Designing safe drop-off areas within development
- Lodging vehicular parking proposals
- Making Payments on CCRS
- Lodging street works proposals
- Understanding Profile (Horizontal/vertical/super elevation) of roads
- Preparation of Declaration Plans

### Published in 2020
- Designing Tactile Tiles for Safe Travel
- Designing Covered Linkways
- Designing Safe Access for developments

Access our guides by scanning this QR code and then navigating to the ‘Guideline’ tab:
